

DxO Optics Pro v5.3.7 – Release Notes

Macintosh (build 7444)

Supported Systems

- Mac OS X 10.4 Tiger
- Mac OS X 10.5 Leopard
- Mac OS X 10.6 Snow Leopard

New features

- New supported camera body (in both Standard and Elite editions) : Canon S90

Third party software compatibility

- Photoshop: the DxO Optics Pro plug-in is compatible with Photoshop CS2, CS3 and CS4
- Lightroom: support for both Lightroom 1.4 and 2.x

Improvements since version 5.3.6

- Under Snow-Leopard, correction of installation problems.
- Under Snow-Leopard, correction of a crash in "Prepare" tab when zooming-in or zooming-out pictures.
- Stability of processing on multi-cores.
- Correction of an activation problem under Snow Leopard (when several user admin accounts available).
- Stability when browsing folders with a lot of images from Olympus camera bodies.
- Compatibility of Photoshop plug-in with Snow Leopard.

Known limitations

- Some Canon bodies perform vignetting correction for JPEG images. DxO Optics Pro does not take into account the correction performed by the camera body. DxO Optics Correction Modules have been created using shots with vignetting body correction disabled. For optimal correction of vignetting by DxO Optics Pro, we recommend disabling the in-camera body vignetting correction while shooting.
- License transfer is not allowed after a manual activation.
- Preset and sidecars are not cross platform compatible (Mac/Windows).
- Lightroom 2.0 smart collections are not accessible from DxO Optics Pro.
- Navigation palette behavior is unreliable in floating mode.
- EXIF information is not displayed until module ambiguity is resolved.
- The field "Size" is not edited in "Image Informations" of the « Prepare » tab.
- Multiple selections in the file browser set to columns mode does not work.
